A. Data Use Agreement

Individual identifiers have been removed from the micro-data contained in the files in this release. Nevertheless, under sections 308 (d) and 903 (c) of the Public Health Service Act (42 U.S.C. 242m and 42 U.S.C. 299 a-1), data collected by the Agency for Health Care Policy and Research (AHCPR) and /or the National Center for Health Statistics (NCHS) may not be used for any purpose other than for the purpose for which it was supplied; any effort to determine the identity of any reported cases, is prohibited by law.

Therefore in accordance with the above referenced Federal Statute, it is understood that:

1. No one is to use the data in this data set in any way except for statistical reporting and analysis; and
2. If the identity of any person or establishment should be discovered inadvertently, then (a) no use will be made of this knowledge, (b) The Director Office of Management AHCPR will be advised of this incident, (c) the information that would identify any individual or establishment will be safeguarded or destroyed, as requested by AHCPR, and (d) no one else will be informed of the discovered identity.
3. No one will attempt to link this data set with individually identifiable records from any data sets other than the Medical Expenditure Panel survey or the National Health Interview Survey.

By using this data you signify your agreement to comply with the above stated statutorily based requirements with the knowledge that deliberately making a false statement in any matter within the jurisdiction of any department or agency of the Federal Government violates 18 U.S.C. 1001 and is punishable by a fine of up to \$10,000 or up to 5 years in prison.

The Agency for Health Care Policy and Research requests that users cite AHCPR and the Medical Expenditure Panel Survey as the data source in any publications or research based upon these data.

B. Background

This documentation describes one in a series of public use files from the Medical Expenditure Panel Survey (MEPS). The survey provides a new and extensive data set on the use of health services and health care in the United States.

The Medical Expenditure Panel Survey (MEPS) is conducted to provide nationally representative estimates of health care use, expenditures, sources of payment, and insurance coverage for the U.S. civilian non-institutionalized population. MEPS also includes a nationally representative survey of nursing homes and their residents. MEPS is cosponsored by the Agency for Healthcare Research and Quality (AHRQ) and the National Center for Health Statistics (NCHS).

MEPS comprises four component surveys: the Household Component (HC), the Medical Provider Component (MPC), the Insurance Component (IC), and the Nursing Home Component (NHC). The HC is the core survey, and it forms the basis for the MPC sample and part of the IC sample. The separate NHC sample supplements the other MEPS components. Together these surveys yield comprehensive data that provide national estimates of the level and distribution of health care use and expenditures, support health services research, and can be used to assess health care policy implications.

MEPS is the third in a series of national probability surveys conducted by AHRQ on the financing and use of medical care in the United States. The National Medical Care Expenditure Survey (NMCES, also known as NMES-1) was conducted in 1977, the National Medical Expenditure Survey (NMES-2) in 1987. Beginning in 1996, MEPS continues this series with design enhancements and efficiencies that provide a more current data resource to capture the changing dynamics of the health care delivery and insurance system.

The design efficiencies incorporated into MEPS are in accordance with the Department of Health and Human Services (DHHS) Survey Integration Plan of June 1995, which focused on consolidating DHHS surveys, achieving cost efficiencies, reducing respondent burden, and enhancing analytical capacities. To accommodate these goals, new MEPS design features include linkage with the National Health Interview Survey (NHIS), from which the sampled households for the MEPS HC are drawn, and continuous longitudinal data collection for core survey components. The MEPS HC augments NHIS by selecting a sample of NHIS respondents, collecting additional data on their health care expenditures, and linking these data with additional information collected from the respondents' medical providers, employers, and insurance providers.

1.0 Household Component

The MEPS HC, a nationally representative survey of the U.S. civilian non-institutionalized population, collects medical expenditure data at both the person and household levels. The HC collects detailed data on demographic characteristics, health conditions, health status, use of medical care services, charges and payments, access to care, satisfaction with care, health insurance coverage, income, and employment.

The HC uses an overlapping panel design in which data are collected through a preliminary contact followed by a series of five rounds of interviews over a 2 1/2-year period. Employing computer-assisted personal interviewing (CAPI) technology, data on medical expenditures and use for two calendar years are collected from each household. This series of data collection rounds is launched each year on a new sample of households to provide overlapping panels of survey data and, when combined with other ongoing panels, will provide continuous and current estimates of health care expenditures.

The sample of households selected for the MEPS HC is drawn from among respondents to the NHIS, conducted by NCHS. The NHIS provides a nationally representative sample of the U.S. civilian non-institutionalized population, with oversampling of Hispanics and blacks.

2.0 Medical Provider Component

The MEPS MPC supplements and validates information on medical care events reported in the MEPS HC by obtaining data directly from medical providers and pharmacies identified by household respondents. The MPC sample includes all hospitals, hospital physicians, home health agencies, and pharmacies reported in the HC. Also included in the MPC are office-based physicians:

- Providing care for HC respondents receiving Medicaid
- Identified through a 75 percent sample of HC households receiving care through an HMO (health maintenance organization) or managed care plan
- Identified through a 25 percent sample of the remaining HC households

Data are collected on medical and financial characteristics of medical and pharmacy events reported by HC respondents, including:

- Diagnoses coded according to ICD-9-CM (9th Revision, International Classification of Diseases) and DSM-IV (Fourth Edition, *Diagnostic and Statistical Manual of Mental Disorders*)
- Physician procedure codes classified by CPT-4 (Common Procedure Terminology, Version 4)
- Inpatient stay codes classified by DRGs (diagnosis-related groups)
- Prescriptions coded by national drug code (NDC), medication names, strength, and quantity dispensed
- Charges, payments, and the reasons for any difference between charges and payments

The MPC is conducted through telephone interviews and mailed survey materials.

3.0 Insurance Component

The MEPS IC collects data on health insurance plans obtained through employers, unions, and other sources of private health insurance. Data obtained in the IC include the number and types of private insurance plans offered, benefits associated with these plans, premiums, contributions by employers and employees, eligibility requirements, and employer characteristics.

Establishments participating in the MEPS IC are selected through four sampling frames:

- A list of employers or other insurance providers identified by MEPS HC respondents who report having private health insurance at the Round 1 interview.
- A Bureau of the Census list frame of private sector business establishments.
- The Census of Governments from Bureau of the Census.
- An Internal Revenue Service list of the self-employed.

To provide an integrated picture of health insurance, data collected from the first sampling frame (employers and insurance providers) are linked back to data provided by the MEPS HC respondents. Data from the other three sampling frames are collected to provide annual national and State estimates of the supply of private health insurance available to American workers and to evaluate policy issues pertaining to health insurance.

The MEPS IC is an annual panel survey. Data are collected from the selected organizations through a prescreening telephone interview, a mailed questionnaire, and a telephone followup for nonrespondents.

4.0 Nursing Home Component

The 1996 MEPS NHC was a survey of nursing homes and persons residing in or admitted to nursing homes at any time during calendar year 1996. The NHC gathered information on the demographic characteristics, residence history, health and functional status, use of services, use of prescription medications, and health care expenditures of nursing home residents. Nursing home administrators and designated staff also provided information on facility size, ownership, certification status, services provided, revenues and expenses, and other facility characteristics. Data on the income, assets, family relationships, and care-giving services for sampled nursing home residents were obtained from next-of-kin or other knowledgeable persons in the community.

The 1996 MEPS NHC sample was selected using a two-stage stratified probability design. In the first stage, facilities were selected; in the second stage, facility residents were sampled, selecting both persons in residence on January 1, 1996, and those admitted during the period January 1 through December 31.

The sample frame for facilities was derived from the National Health Provider Inventory, which is updated periodically by NCHS. The MEPS NHC data were collected in person in three rounds

of data collection over a 1½-year period using the CAPI system. Community data were collected by telephone using computer-assisted telephone interviewing (CATI) technology. At the end of three rounds of data collection, the sample consists of approximately 815 responding facilities, 3,100 residents in the facility on January 1, and 2,200 eligible residents admitted during 1996.

5.0 Survey Management

MEPS data are collected under the authority of the Public Health Service Act. They are edited and published in accordance with the confidentiality provisions of this act and the Privacy Act. NCHS provides consultation and technical assistance.

As soon as data collection and editing are completed, the MEPS survey data are released to the public in staged releases of summary reports and microdata files. Summary reports are released as printed documents and electronic files. Microdata files are released on CD-ROM and/or as electronic files. A catalog of all MEPS products released to date is provided on the AHRQ web site (<http://www.meps.ahrq.gov/>).

Printed documents and CD-ROMs are available through the AHRQ Publications Clearinghouse. Write or call:

AHRQ Publications Clearinghouse

888/586-6340 (toll-free TDD service; hearing impaired only)

Be sure to specify the AHRQ number of the document or CD-ROM you are requesting. Selected electronic files are available from the Internet on the AHRQ home page: <http://www.meps.ahrq.gov/>.

Additional information on MEPS is available from the MEPS project manager or the MEPS public use data manager at the Center for Cost and Financing Studies, Agency for Healthcare Research and Quality, 2101 East Jefferson Street, Suite 500, Rockville, MD 20852 (301/594-1406).

C. Technical Information

1.0 Introduction

This document describes the projected household expenditure data for 1998-2008 from the 1996 Medical Expenditure Panel Survey (MEPS) issued by the Center for Cost and Financing Studies (CCFS), within the Agency for Healthcare Research and Quality (AHRQ). These files (hereafter referred to as the PMEPyy.DAT files for yy = 98, ..., 08) contain person level data with (i) personal medical expenditures classified by type of service and source of payment categories, (ii) a person weight that enables national-level estimates, (iii) individual level demographic characteristics used in the re-weighting procedure and iv) insurance and poverty status variables, not controlled for in the aging process¹.

Expenditure projections evolve from the original 1996 MEPS HC sample. A detailed analysis of 1996 medical expenditures by Selden et. al (2001)² found only an 8% difference between expenditures in MEPS and comparably-defined expenditure estimates from the National Health Accounts (NHA), released by the Centers for Medicare and Medicaid Services (CMS)^{3, 4}.

Core data from the 1996 MEPS are projected to each designated end year between 1998 and 2008⁵ by adjusting MEPS person weights using Census and Vital Statistics data on population growth characteristics over time. The re-weighted MEPS expenditures are then calibrated to each designated end year by type of service and source of payment categories so that growth in the re-weighted MEPS expenditures matches growth in the projected National Health Accounts^{6, 7}.

Each of the aged PMEPyy.DAT files is a person level ASCII data file. Each file contains a sample of 22,601 people, has one record for each person, and is designed to provide estimates that

¹ Researchers should use these variables with caution. The MEPS data did not control for changes in these measures when aging the data, so any estimates with the projected data cross-classified by the poverty status or health insurance status variables are based on the assumption that 1996 poverty and health insurance status conditions remain unchanged in each future year. Any changes in poverty rates or health insurance status of individuals observed in the projected MEPS are an indirect result of the changing age, race and sex composition of the population that was directly controlled for in aging the data. These variables are included in the projected data sets purely for the convenience of end-users.

² Selden, Thomas M., et. al., "Reconciling Medical Expenditure Estimates from the Medical Expenditure Panel Survey and the National Health Accounts." Forthcoming, *Healthcare Financing Review*.

³ The Centers for Medicare and Medicaid Services (CMS) was formerly known as the Health Care Financing Administration (HCFA).

⁴ Total MEPS expenditures were found to be 8% below those in the NHA for comparably defined categories.

⁵ As actual MEPS data are released in the future for a given year the projected data will be removed from the web site to avoid confusing MEPS data users. For example, at the time of release, actual 1997 MEPS data were ready for release, so the projected 1997 MEPS estimates were withheld from the web site. There will also be periodic updates to the projected data, replacing this initial release as aging techniques are refined and as new data become available from input sources. (MEPS, NHA, Census, Vital Statistics)

⁶ CMS's 1999 figures from file NHE65-10.CSV are used for NHA expenditures. This data file is available to the public on the CMS web site: <http://www.hcfa.gov>. The file can be found in the Statistics and Data section on the page entitled "National Health Care Expenditure Projections". In the file, NHE65-10.CSV, data for 1996-1999 are true expenditures, while data for 2000-2010 are projected expenditures.

⁷ In order to calibrate MEPS to the NHA, nursing home and assisted living expenditures by type of service and source of payment first had to be added to the MEPS expenditures because the survey does not collect these expenditures. There will be more detail on this adjustment in section 4.1 of this documentation.

are representative of the civilian, non-institutionalized population of the US in the designated year. While each record is distinguished by a person-level identification number, this variable does not enable researchers to link data from the projected MEPS files to other MEPS data releases⁸.

Tables 4-6 in the Appendix provide summary statistics on various characteristics from each year of the projected MEPS files. As actual MEPS data become available, statistics from the true MEPS data will replace those from the projected MEPS in these tables. Currently, the Appendix tables contain true statistics from the 1996 and 1997 MEPS surveys and projected statistics from 1998 through 2008⁹.

2.0 Medical Expenditures: Type of Service and Source of Payment Categories

Each person record contains data on the expenditures made within 14 different types of service categories plus a total expenditure category. Each of the type of service expenditures is categorized into one of seven major categories below. Total expenditures for each major category can be calculated by adding expenditures for all sub-categories within that group. For example, to obtain total expenditures for Physician services, it is necessary to add expenditures for Office Visits (OBD) and Hospital Events (OBH). Total expenditures (TOT) equal the sum of the 14 type of service expenditure variables¹⁰. The categories and their three character abbreviations are as follows:

- A. Hospital**
 - 1. Emergency Room: ERF
 - 2. Inpatient: IPF
 - 3. Outpatient: OPF
- B. Physician**
 - 4. Office Visits: OBD
 - 5. Hospital Events¹¹: OBH
- C. Other Medical**
 - 6. Glasses: VIS
 - 7. Other: OTH
- D. Home Health**
 - 8. Agency: HHA
 - 9. Non-Agency: HHN
- E. Other Provider**
 - 10. Other Provider OBO

⁸ Person identification numbers that would enable direct linkage of the projected MEPS data to previously released un-aged MEPS files were purposely omitted to prohibit users from making projections for population groups that were not statistically controlled for in the aging process.

⁹ Users should note that while the expenditure data in the PMEPpy.DAT files is rounded to integers, Appendix Tables 4-6 were calculated before the data was truncated. As a result, users trying to replicate these tables might find small differences in results for per capita expenditures.

¹⁰ The following relationship is true: TOT = ERF + IPF + OPF + OBD + OBH + VIS + OTH + HHA + HHN + OBO + DVO + DVG + DVR + RX.

¹¹ These expenditures represent separately billed physician expenditures for hospital events.

- F. Dental**
 - 11. Orthodontist: DVO
 - 12. General: DVG
 - 13. Other: DVR
- G. RX**
 - 14. RX
- H. TOTAL:**
 - 15. Total: TOT¹²

The expenditures in each category are also divided into 9 sources of payment, plus a total. Total expenditures (EXP) equal the sum of the 9 source of payment expenditure variables¹³. Those categories and their two to three character abbreviations are as follows:

- 1. Out of Pocket: OOP
- 2. Private Health Insurance: PRV
- 3. Medicare: MCR
- 4. Medicaid: MCD
- 5. Champus: CHM
- 6. VA: VA
- 7. Workers Comp: WCP
- 8. Other Public: OFS
- 9. Other: OTR
- 10. **TOTAL: EXP¹²**

Expenditure variables are named with the following convention: TosSopYY (i) the first three characters are the three character type of service code, (ii) the next two to three characters are the two to three character source of payment code and, (iii) the final two numbers are the last two digits of the end year. For example, if an individual had an out of pocket general dental expense and a researcher wanted to access the projected expense in 2003, the variable of interest would be DVGOOP03. (i) DVG is the three character type of service code for general dental expenses, (ii) OOP is the three character source of payment code for out of pocket payment and, (iii) 03 represents the end year 2003.

There are a total of 150 expenditure variables for all the type of service variables crossed with all the source of payment variables above. A full array of the 150 TOS by SOP variables can be found in Table 1 in the appendix. The abbreviations for the variables were purposely chosen to coincide with 1996 MEPS naming conventions when possible. Table 2 in the appendix gives further details on which expenditure variables from the 1996 MEPS file are associated with each variable in the projected files.

¹² Note that Total Expenditures (TOT) by type of service equals Total Expenditures (EXP) by source of Payment.

¹³ $EXP = OOP + PRV + MCR + MCD + CHM + VA + WCP + OFS + OTR.$

3.0 Population Aging

Each person record includes a person-level sample weight needed to produce estimates for the civilian, non-institutionalized population of the US in the designated year. The weight on each file (WTADJyy) is derived from the 1996 MEPS weight. It is adjusted to reflect changes in the non-institutionalized civilian population between 1996 and the designated end year in a three-step process. First, the weights are adjusted to reflect population growth by age, race and sex based on the Census Bureau's Middle Series population projections. Second, the weights are adjusted for changes in fertility rates by race. The third and final weight adjustment is for mortality rates by race. The fertility and mortality adjustments are based on historical data from Vital Statistics and projections from the Census Bureau's Middle Series Components of Change projections.

3.1 Population Estimates and Projections

Individuals in the 1996 MEPS sample are placed into cells based on age, race and sex categories to match definitions in US Census Bureau population projections. The categories are broken down as follows: (i) Age: each year from 0 to 99 and 100+, (ii) Sex: Male, Female (iii) Race: Hispanic, Non-Hispanic White, Non-Hispanic Black, Asian/Pacific Islander, American Indian/Eskimo/Aleut. Population growth rates are calculated for each age, race, sex cell from 1996 to the designated end year using Census historical data and the Census Middle Series projected data by age, race and sex¹⁴. These growth rates are then applied to the person-level weights in the 1996 MEPS file by age, race and sex.

3.2 Fertility Adjustments

The second step in the re-weighting process involves fertility adjustments. These adjustments are made to population weights for two primary reasons: 1) fertility rates are expected to change significantly over the projected period for certain sectors of the population and 2) fertility events are associated with relatively high medical expenditures. It should be noted that the fertility adjustments are somewhat different from the population adjustments.

For fertility adjustments women in the 1996 MEPS were placed into the following race cells: Hispanic, Non-Hispanic White, Non-Hispanic Black, Asian/Pacific Islander, American Indian/Eskimo/Aleut. The sample does not contain enough births to support fertility cells based on age and race and require the assumption that fertility changes over time are constant for women of all ages in each race category. This prohibits researchers from investigating fertility for particular age groups, such as teens or older women, who may be expected to have greater fluctuation in fertility over time relative to other women within their same race category.

Fertility growth rates are calculated for each race cell from 1996 to the designated end year using Vital Statistics¹⁵ historical data and the Census Middle Series projected fertility data by race¹⁶.

¹⁴ Historical Data are "National Population Estimates for the 1990's Monthly Postcensal Civilian Non-institutional Population, by single year of age, sex, race and Hispanic origin" for July 1 of each year. Projected data are "Annual Population Projections of the United States by age, race, sex and Hispanic origin and nativity: 1999 to 2010." File NP-D1-A Middle Series P2001_10a.zip.

¹⁵ Historical Birth Rates 1996-1998 are obtained from National Vital Statistics Report, Volume 48, Number 3 "Births Final Data 1998." Tables 8, 9.

These race specific growth rates are then applied to the person-level weight for each woman who gave birth in the 1996 MEPS sample. In order to maintain a constant total population by race, a final adjustment is made to the person-level weights for those women who did not give birth in the 1996 MEPS sample. The size of this adjustment depends on how many women in the race cell gave birth and the size of the growth adjustment applied to the women who gave birth.

3.3 Mortality Adjustments

The third and final step in the re-weighting process involves mortality adjustments. These adjustments are identical in practice to the fertility adjustments, except that they are applied to both men and women. The adjustments are made for two primary reasons: 1) mortality rates are expected to change significantly over the projected period for certain sectors of the population and 2) mortality events are associated with relatively high medical expenditures.

Individuals in the 1996 MEPS were placed into the following race, sex cells: (i) Hispanic, Non-Hispanic White, Non-Hispanic Black, Asian/Pacific Islander, American Indian/Eskimo/Aleut, (ii) male, female. As with fertility, the sample does not contain enough deaths to support mortality cells based on age, race and sex, and requires the assumption that mortality changes over time are constant for individuals of all ages in each race and sex category. This constraint prohibits researchers from investigating mortality for particular age groups, such as infants or the elderly, who may be expected to have greater changes in mortality over time relative to other individuals within their same race category. For example, declines in mortality for a specific age group will be averaged over individuals of all ages in their race and sex category, leading to a lower probability of death for everyone in that particular race and sex cell.

Mortality growth rates are calculated for each race cell from 1996 to the designated end year using Vital Statistics¹⁷ historical data and the Census Middle Series projected mortality data by race and sex¹⁸. These race, sex specific growth rates are then applied to the person-level weight for each individual who died in the 1996 MEPS sample. In order to maintain a constant total population by race and sex, a final adjustment is made to the person-level weights for those individuals who did not die in the 1996 MEPS sample. The size of this adjustment depends on how many individuals die in a given race, sex cell and the size of the growth adjustment applied to those who die.

¹⁶ Projected Birth Rates Data are obtained from U.S. Census. "Population Projections of the United States by Age, Sex, Race, Hispanic Origin and Nativity: 1999 to 2100." File NP-D5-B Age-Specific Fertility Rates of the Resident Population by Age, Sex, Race, and Hispanic Origin: Middle Series, 1999 to 2100.

¹⁷ Historical Death Rates 1996 are obtained from National Vital Statistics Reports Volume 47, Number 9, "Deaths: Final Data 1996." Tables 2, 3.

Historical Death Rates 1997 are obtained from National Vital Statistics Reports Volume 47, Number 19, "Deaths: Final Data 1997." Tables 2, 3.

Historical Death Rates 1998 are obtained from National Vital Statistics Reports Volume 48, Number 11, "Deaths: Final Data 1998." Tables 2, 3.

¹⁸ Projected Death Rates Data are obtained from U.S. Census. "Population Projections of the United States by Age, Sex, Race, Hispanic Origin and Nativity: 1999 to 2100." File NP-D5-A Life-Tables of the Resident Population by Age, Race, Sex and Hispanic Origin: Middle Series 1999 to 2100.

4.0 Calibration to National Health Accounts

The last step of the aging process is a calibration of each re-weighted MEPS file to the National Health Accounts for the same year by type of service and source of payment. This process ensures that growth rates in MEPS expenditures by type of service and source of payment between 1996 and a designated end year will be in accordance with growth rates predicted by the National Health Accounts.

In order to calibrate MEPS to the National Health Accounts, it is first necessary to obtain expenditures for nursing home and assisted living for 1996, because MEPS does not include these expenditures in the survey. These totals are available from Actuarial Research Corporation (ARC)¹⁹ by type of service and source of payment for 1996. For 1998-2008, the ARC totals are aged by the growth rates projected by CMS in the National Health Accounts for number of nursing home bed days²⁰. CMS uses nursing home bed days to project Nursing Home expenditures. In the absence of demographic estimates of changes in the nursing home and assisted living populations over the time period studied, it is assumed that the growth rate in nursing home bed days approximates the demographic changes in this population.

The calibration procedure is as follows for each designated end year: (i) Expenditures from the re-weighted MEPS file are totaled by the seven major type of service categories and the nine source of payment categories for a total of 63 TOS-SOP cells. (ii) Nursing home and assisted living expenditures are added to the 1996 MEPS expenditures by type of service and source of payment. (iii) "Aged" nursing home and assisted living expenditures for the designated end year are added to the totals from the re-weighted MEPS file by type of service and source of payment. (iv) Growth rates from 1996 to the designated end year are calculated for each of the TOS-SOP categories for the MEPS re-weighted data. (v) Growth rates are calculated for the corresponding TOS-SOP categories for the National Health Accounts using historical and projected data based on 1999 estimates from CMS. (vi) Using the NHA and MEPS growth rates, a calibration factor²¹ is created for each TOS-SOP category for the designated end year. (vii) Expenditures in the re-weighted MEPS file are multiplied by TOS-SOP specific calibration factors. Calibration adjustments are done at the major type of service category level, not at the sub-category level because the NHA does not project expenditures at the sub-category level for type of service.

5.0 File Variables

The output files contain person level data with (i) personal medical expenditures classified by 15 (including a total) type of service and 10 (including a total) source of payment categories, (ii) a person weight that enables national-level estimates, (iii) individual level demographic

¹⁹ Nursing home and assisted living expenditures by type of service and source of payment: Unpublished data made available from Actuarial Research Corporation for completion of Selden et. al. 2001.

²⁰ Unpublished data made available by CMS.

²¹ The calibration factor is calculated as follows: (growth rate for NHA expenditures/growth rate for population aged MEPS expenditures). Note there is a different calibration factor for each designated end year and for each TOS-SOP category, using only major TOS categories because NHA does not project expenditures for sub-categories. In applying calibration factors, TOS sub-categories are assigned the calibration factor of the appropriate major category. See Table 3 in the appendix for the corresponding NHA and MEPS expenditures used for the calibration.

characteristics used in the re-weighting procedure and iv) insurance and poverty status variables, not controlled for in the aging process. Variable definitions and codebooks are listed below:

5.1 Variable List

PERSIDP	Person identification number
WTADJyy	1996 person weight adjusted to end year YY for population, fertility and mortality
AGESTUB	Age in years, top-coded at 90
RACE5	Five category race variable
SEX	Sex
LIVEBRTH	Birth Indicator
VITLSTAT	Death Indicator
INSCOV_A	Insurance status for individuals under age 65 - annual measure
INSCOV_B	Insurance/Medicaid status for individuals age 65 and over - annual measure
POVCAT	Poverty status based on family income - annual measure
MCRHMO1	HMO status for those enrolled in Medicare - point in time measure
UPRHMO1	HMO status for those with private health insurance - point in time measure
UPUBHMO1	HMO status for those with Medicaid or other public (excluding Champus) health insurance - point in time measure
TOTEXPyy- RXOTRyy	Expenditures by type of service and source of payment 150 categories

5.2 Control Variables

Population Control Variables	AGESTUB, RACE5, SEX
Fertility Adjustment Control Variables	RACE5, SEX=2
Mortality Adjustment Control Variables	RACE5, SEX

5.3 Variable Definitions and Codebook

Key expenditure and control variables

PERSIDP	Unique person identification number for each individual on the MEPS file. This variable is the same across all projected years of MEPS but it cannot be used to link to other MEPS data sets. Person identification numbers that would enable direct linkage of the projected MEPS data to previously released un-aged MEPS files were purposely omitted to prohibit users from making projections for population groups that were not statistically controlled for in the aging process. Note that this remains a danger for variables released on this file for insurance status and poverty. Researchers should also caution, that while persidp can link projected data for the same individual across years, these data do not represent a panel of expenditures for an individual over time, but rather a single cross-section of individuals aged to different points into the future.
----------------	---

<i>WTADJyy</i>	1996 person weight adjusted to end year YY for population, fertility and mortality. These weights allow researchers to get national level population estimates. Researchers should be careful when sub-setting by control variables. Un-weighted cell sizes must be greater than 100 individuals to obtain nationally representative estimates. Cell sizes can get very small when using variables such as age (especially when using single year categories), livebrth, and vitlstat.
<i>AGESTUB</i>	Age of individual as of Dec. 31, 19yy. Note: A similar age variable used for population re-weighting was top-coded at 100. The variable released on this file is more restrictive for confidentiality purposes. <u>Definition:</u> Age in years from 0 to 90, top-coded at 90.
<i>RACE5</i>	Race of individual, used for population re-weighting, fertility and mortality adjustments. <u>Definition:</u> 1 = Hispanic 2 = White -Non-Hispanic 3 = Black - Non-Hispanic 4 = Asian/Pacific Islander 5 = American Indian/Aleut
<i>SEX</i>	Sex of individual, used for population re-weighting, fertility and mortality adjustments <u>Definition:</u> 1 = Male 2 = Female
<i>LIVEBRTH</i>	Birth indicator for individual, used in fertility adjustments. <u>Definition:</u> -1 = missing value or not applicable (male) 0 = Did not have a live birth in 1996 1 = Had a live birth in 1996
<i>VITLSTAT</i>	Death indicator for individual, used in mortality adjustments <u>Definition:</u> 0 = Alive in all of 1996 1 = Died in 1996

TOTEXPy-
RXOTRyy

Medical expenditure variables by type of service and source of payment. The variable contains actual expenditure amount in dollars. Each year there are 150 variables covered by the type of service and source of payment categories. See section 2 for detailed information on the naming convention of these variables. Section 2 will also provide detailed information on the mathematical relationship between these variables and how the variables can be summed to create expenditure totals for major type of service categories.

Additional variables, not statistically controlled for in aging

The following variables are created for the convenience of end users of the projected MEPS expenditure data. These variables were NOT statistically controlled for when aging the data. Researchers should be cautioned that any estimates using the projected data cross-classified by poverty status or insurance status are based on the assumption that 1996 poverty and health insurance conditions remain unchanged in each future year.

INSCOV_A

Insurance status for individuals under age 65. (AGESTUB < 65) This variable is an annual measure, measuring whether the individual had insurance at any point during the year. Because individuals can have coverage from multiple health insurance sources, this variable is built hierarchically. All individuals ages 65 and over, regardless of insurance status, are placed in category 5; INSCOV_B will measure insurance status for these individuals. Note: Employment related private insurance in category 1 does not include self employed persons with firm size of 1 who purchase health insurance for themselves. These individuals would be assigned, instead, to category 2.

Definition:

- 1 = Any Private, employment related or CHAMPUS insurance during the year
- 2 = Any Private, not employment related insurance during the year
- 3 = Any Public (Medicaid or Medicare) insurance during the year
- 4 = Uninsured for entire year
- 5 = Age 65 or older

INSCOV_B

Insurance/Medicaid/Medicare status for individuals age 65 and over. (AGESTUB >= 65) This variable is an annual measure, measuring whether the individual had insurance at any point during the year. Because individuals can have coverage from multiple health insurance sources, this variable is built hierarchically. Several categories of this variable are intended to measure whether individuals held multiple coverage sources at the same time. For example, category 3 includes an individual who was covered by both Medicare and a privately purchased policy in the month of February but does not include someone who was covered only by a privately purchased policy in January and covered only by Medicare in March. This second individual would fit in category 4. Note: Employer insurance in category 2 does not include persons who were self employed with firm size of 1 who had

purchased health insurance for themselves. These individuals would be assigned, instead, to category 3.

Definition:

-1 = inapplicable (under age 65)

1 = Held both Medicaid and Medicare at the same time during the year

2 = Held both Medicare and employer or union group insurance at the same time during the year

3 = Held both Medicare and individually purchased insurance at the same time during the year

4 = Held Medicare alone during the year

5 = Held no Medicare during the year

POVCAT Poverty status based on family income.

Definition:

1 = less than 1.00 times poverty line

2 = 1.01 to 1.24 times poverty line

3 = 1.25 to 1.99 times poverty line

4 = 2.0 to 3.99 times poverty line

5 = 4.00 or more times poverty line

MCRHMO1 Individual was enrolled in a Medicare HMO at the time of first interview. Unlike the annual INSCOV variables above, this variable is a point-in-time measure, collected during the first interview of the 1996 MEPS survey.

Definition:

-1 = inapplicable, not ascertained or no data in round

1 = yes

2 = no

UPRHMO1 Individual was enrolled in a private HMO at the time of first interview. Unlike the annual INSCOV variables above, this variable is a point-in-time measure, collected during the first interview of the 1996 MEPS survey.

Definition:

-1 = inapplicable, not ascertained or no data in round

1 = yes

2 = no

UPUBHMO1 Individual was enrolled in a Medicaid or other public HMO at the time of first interview. Unlike the annual INSCOV variables above, this variable is a point-in-time measure, collected during the first interview of the 1996 MEPS survey.

Definition:

-1 = inapplicable, not ascertained or no data in round

1 = yes

2 = no
